

1. Information about the indicator	
The goal	Ensure healthy lives and promote well-being for all at all ages
Task	Substantially increase health financing and the recruitment, development, training and retention of the health workforce in developing countries, especially in least developed countries and small island developing States
Indicator name of the global indicator National indicator	Health worker density and distribution
2. Information about the organization	
Organization	Ministry of Health of the Republic of Kazakhstan
3. Definitions and concepts	
Definition	Doctor density: The density of doctors is defined as the number of doctors, including specialist doctors and medical professionals per 10,000 people in a country or at the level of territorial country units. Density of nursing and midwifery staff: The density of nursing and midwifery staff is defined as the number of nursing and midwifery staff per 10,000 people in a country or at the level of territorial country units. Density of dentists: The density of dentists is defined as the number of dentists, dental technicians / assistants and associated staff per 10,000 people in the country or at the level of territorial country units. Pharmaceutical personnel density: Pharmaceutical personnel density is defined as the number of pharmacists, pharmaceutical assistants, technicians/assistants, and support staff per 10,000 people in a country or at the level of territorial country units
Basic concepts	Medical workers are persons with medical or pharmaceutical education, as well as performing professional functions in providing medical care, care, diagnosis, prevention and treatment of diseases. Doctors (including specialist doctors) are specialists who have received higher medical education and have the right to practice medicine in accordance with the procedure established by law. Nursing and obstetric staff - persons with post-secondary medical education (Nursing (applied Bachelor's degree), with technical and professional medical educational institutions that perform the functions of patient care, nursing supervision, prevention, and obstetric care. Dentists and dental staff are specialists providing dental services, including dentists, dental technicians, dentists, and support staff. Pharmaceutical personnel are specialists engaged in the production, storage, distribution and control of medicines, including pharmacists (pharmacists), pharmacists with technical and professional pharmaceutical education. The density of medical workers is an indicator reflecting the ratio of the number of employees of a certain category (doctors, nurses, pharmacists, etc.) and the population, expressed per 10,000 people.
Justification and explanation	The indicator reflects the level of security of the population The Republic of Kazakhstan's medical personnel and their distribution by the main categories of medical workers. It is used to assess the potential of the healthcare system in ensuring accessibility and quality of medical care. Interpretation of the indicator: - a higher density of medical workers indicates greater accessibility of medical services and the potential of the healthcare system for sustainable development; - regional differences in indicators indicate an uneven distribution of human resources and the need to take targeted measures to equalize them; - The indicator serves as the basis for personnel planning, determining priority

	areas for training and stimulating medical professionals.
4. Sources and collection methods	
Data sources	administrative data State statistical reporting: - Form No. 17 — "Report on the number of medical workers"; - Form No. 19 — "Report on medical organizations and medical personnel"; - IS SUR Information System (information system resource management); - Demographic data - Bureau of National Statistics Agencies for Strategic Planning and Reforms of the Republic of Kazakhstan.
Data collection methods	Data collection on the indicator is carried out on the basis of state statistical reports and administrative sources of the Ministry of Health of the Republic of Kazakhstan. The data is aggregated annually based on the results of the reporting period (calendar year). Data collection process: Medical organizations annually submit statistical reports in accordance with the approved forms of state statistical observation. The territorial branches of the National Research Center carry out validation and consolidation of data at the regional level. The central office of the NSCRZ carries out the report, verification and subsequent coordination of indicators. After verification, the data is sent to the Ministry of Health of the Republic of Kazakhstan for verification and subsequent transmission to the Bureau of National Statistics for inclusion in national statistical publications and international reports. Tools and standards: Electronic reporting forms and 3 automated information systems are used); A unified classification system is applied according to Class Classifier; The data is subject to a double validation check - at the source (medical organization) level and when aggregated by the Ministry Healthcare of the Republic of Kazakhstan
Unit of measurement	Per 10,000 population
Frequency	Annually The observation period is 1 calendar year (from January 1 to 31 December).
5. Calculation method and other methodological considerations	
Calculation method:	Traditionally, this indicator was estimated from two positions: the density of doctors and the density of nursing and obstetric staff. In the context of the SDG agenda, the indicator includes doctors, nurses, midwives, dental staff, and pharmaceutical staff. It is planned that the data will gradually cover all categories of medical personnel. The method of estimating the number of doctors (including general practitioners and specialist doctors) may include practitioners or all registered doctors, depending on the nature of the original data source. The number of nursing and midwifery staff includes nursing and midwifery staff whenever possible. In many countries, nurses who have been trained in midwifery skills are counted as regular nurses. In this regard , the division into nursing and obstetric staff is difficult. The number of dental staff includes dentists, dental technicians/assistants, and related workers. Due to the variability of the classifications of professional and associate levels, a clear division into groups is not always possible. Data on the number of pharmaceutical personnel include pharmacists, pharmaceutical technicians/assistants, and related workers. Due to the variability of the classifications of professional and associate levels , a clear division into groups is not always possible.

Reviews and restrictions:	Data on the number of medical workers is most fully reflected in the public sector, and may underestimate the active workforce in private, military, non-governmental , and faith-based organizations. Since data is not collected on an annual basis by all countries, the latest available data is highlighted. Due to differences in data sources, the coverage, frequency, quality, and completeness of the source data vary significantly from country to country.
6. Data availability and fragmentation	
Data availability and gaps:	The data is available on the website of the Bureau of National Statistics. Strategic Planning and Reform Agencies Of the Republic of Kazakhstan.
Disassembly level:	The data is disaggregated by place of residence (urban/rural), geographical regions.
7. Comparison with international data / standards	Following the approval of the Global Strategy for Human Resources Development in Healthcare: Workforce 2030 (WHA 69.19) to address Human Resources Challenges for Healthcare (HRH) at the 69th session of the World Health Assembly, May In 2016, Member States were tasked with consolidating a key set of health workforce data with annual reporting to the Global Health Observatory, as well as gradually implementing national health workforce accounts, in support of national policy and planning within the Global monitoring and reporting strategies.
