

1. Information about the indicator	
Goal	Ensuring the transition to rational consumption and production models
Task	By 2030, significantly reduce the volume of waste by taking measures to prevent its formation, reduce it, recycle and reuse it.
The indicator	The share of processing and disposal of industrial waste in their formation
2. Information about the organization	
Organization	Ministry of Ecology and Natural Resources of the Republic of Kazakhstan
3. Definitions and concepts	
Definition	Determines the level of processing and disposal of industrial waste (to their formation).
Basic concepts:	Production waste is the remains of raw materials, materials, other products and products formed during the production process and which have lost all or part of their original consumer properties.; Waste recycling is a physical, chemical or biological process, including sorting, aimed at extracting raw materials and (or) other materials from waste that are later used in the production (manufacture) of goods or other products, as well as changing the properties of waste in order to facilitate their handling, reduce their volume or dangerous properties.; Waste disposal is the use of waste as secondary material or energy resources.
Justification and interpretation	The indicator allows you to assess the level of circularity of the economy, that is, how effectively waste flows are returned to the beginning of the product chain as secondary raw materials. The essence of the circular economy is that almost all types of waste will be recycled, providing secondary material resources and energy, as well as a gradual approach to "zero" waste disposal in landfills.
4. Data sources and collection methods	
Data sources	Territorial departments of ecology
Data collection methods	Administrative accounting of the Ministry of Ecology and Natural Resources of the Republic of Kazakhstan
Unit of measurement	Percent
Periodicity	annually
5. Calculation method and other methodological considerations	
Calculation method:	It is defined as the ratio of the volume of processed and disposed production waste to the volume of generated production waste during the reporting period, multiplied by 100. According to the formula: $\% \text{ per/scrap} = V_{\text{per/scrap}} * 100 / V_{\text{obr}}$, where $\% \text{ per/scrap}$. – the total percentage of processing and disposal of industrial waste (by republic, by region); $V_{\text{per/scrap}}$ – the total volume of processed and disposed production waste (by republic, by region); V_{obr} is the total volume of generated industrial waste (by republic, by region).
Comments and restrictions:	
6. Data availability and disaggregation	

Data availability and gaps:	The data is available: - on the website of the MENR RK, - on the website of the Bureau of National Statistics
The level of disaggregation:	The data is disaggregated: - at the country level, - at the regional level.
7. Comparability with international data/standards
