

1. Information about the indicator	
Goal	Protection, restoration of terrestrial ecosystems and promotion of their rational use, rational forest management, combating desertification, stopping and reversing the process of land degradation and ending the process of loss
Task	By 2020, ensure the conservation, restoration and rational use of terrestrial and inland freshwater ecosystems and their services, including forests, wetlands, mountains and drylands, in accordance with obligations arising from international agreements
The indicator	Forest area as a percentage of the total land area.
2. Information about the organization	
Organization	Committee of Forestry And Wildlife of The Ministry Of Ecology And Natural Resources Of The Republic Of Kazakhstan
3. Definitions and concepts	
Definition	To ensure an accurate definition of the indicator, it is extremely important to define " Forest" and "Total land area": - A forest is defined as: "land with an area of more than 0.5 hectares with trees above 5 meters and a canopy cover of more than 10 percent or trees capable of reaching these thresholds at the landing site. It does not include lands that are mainly used for agricultural or urban land use."; - Total land area-the total area of the country, with the exception of the territory covered by internal waters, for example, the main rivers and lakes.
Basic concepts:	The indicator reflects the relative prevalence of forests in the country. Accurate data on the country's forest area is a key element of forestry policy and planning in the context of sustainable development. Changes in forest area reflect demand for land for other uses and can help identify unsustainable practices in the forestry and agricultural sectors. The forest area as a percentage of the total land area can be used as a rough representation of how much forests in a country are being preserved or restored, but this is an unnecessary part of the measurement system to the extent to which they are sustainably managed.
Justification and interpretation	Forests perform a number of functions that are vital to humanity, including the provision of goods (wood and non-wood forest products) and functions such as habitat for biodiversity, carbon capture, coastal protection, and soil and water conservation.
4. Data sources and collection methods	
Data sources	Statistical reporting Form No. 1 and an explanatory note to the forest management materials
Data collection methods	The reports are provided by the regional territorial inspections of forestry and wildlife, state national nature parks, state nature reserves, state forest reserves and forestry institutions under the operation of local executive bodies.
Unit of measurement	Percentage of total land area
Periodicity	Minute by minute
5. Calculation method and other methodological considerations	

Calculation method:	Forest area (reporting year)*100 / Land area
Comments and restrictions:	To achieve this indicator, it is necessary to follow articles 20, 23 of the Law of the Republic of Kazakhstan "on Specially Protected Natural territories", Chapter 12 and Article 51-1 of the Forest Code of the Republic of Kazakhstan dated July 8, 2003 and other regulatory legal acts arising from legislation in the field of forestry and specially protected natural territories.
6. Data availability and disaggregation	
Data availability and gaps:	General information is available on the websites of the Ministry of Ecology and Natural Resources and its departments and subordinate institutions.
The level of disaggregation:	The data is disaggregated at the country and regional levels
7. Comparability with international data/standards	Differences may exist between the indicator data among countries presented internationally, since the forest area of each country is different.
8. References and documentation	Statistical reporting in form No. 1, link to the website of the Ministry of Ecology and Natural Resources of the Republic of Kazakhstan and its departments and subordinate organizations https://www.gov.kz/memleket/entities/ecogeo?lang=ru
