

1. Information about the indicator	
Goal	Ensuring access to affordable, reliable, sustainable and modern energy sources for all
Task	By 2030, expand infrastructure and modernize technologies for modern and sustainable energy supply to all in developing countries, in particular least developed countries, small island developing States and landlocked developing countries, taking into account their respective support programmes
The indicator	Installed capacities of renewable energy facilities
2. Information about the organization	
Organization	Ministry of Energy of the Republic of Kazakhstan
3. Definitions and concepts	
Definition	An indicator that determines the total rated electrical capacity of all commissioned renewable energy (RES) facilities in a country (or region). It is calculated as the sum of the installed capacities of all existing renewable energy installations, expressed in megawatts (MW).
Basic concepts:	Renewable energy sources are energy sources that are continuously renewable due to naturally occurring natural processes, including the following types: solar radiation energy, wind energy, hydrodynamic water energy; Geothermal energy: heat from the ground, surface and underground water bodies; as well as anthropogenic sources of primary energy resources: consumer waste, biomass, biogas and other fuels from consumer waste used for the production of electric and (or) thermal energy. (Source: The LRK "On support for the use of renewable energy sources", information and legal system of regulatory legal acts of the Republic of Kazakhstan "Adilet")
Justification and interpretation	The installed capacities of renewable energy facilities will reduce emissions of pollutants into the atmosphere, create more comfortable living conditions for the population and generally contribute to improving the environmental situation. Also, increasing the installed capacity of renewable energy facilities helps to reduce dependence on fossil energy sources, increase the sustainability of the energy system and achieve national goals for decarbonization of the economy.
4. Data sources and collection methods	
Data sources	Data from the Ministry of Energy of the Republic of Kazakhstan, akimats of regions, cities of republican significance and the capital, LLP "Settlement and Financial Center for support of renewable Energy use".
Data collection methods	Based on reports provided by the akimats of the regions, the city of republican significance and the capital, as well as data received from the LLP "Settlement and Financial Center for support of the use of renewable energy". The authorized body in the field of energy collects, summarizes and analyzes information to determine the total installed capacity of renewable energy facilities in the country, by region and types of renewable energy sources.
Unit of measurement	MW
Periodicity	As new renewable energy facilities are being renovated or put into operation.

5. Calculation method and other methodological considerations	
Calculation method:	The installed capacities of renewable energy facilities are calculated as the sum of the nominal electrical capacities of all commissioned facilities using renewable energy sources.
Comments and restrictions:	-
6. Data availability and disaggregation	
Data availability and gaps:	The data is available on the website of the Ministry of Energy of the Republic of Kazakhstan.
The level of disaggregation:	The data is disaggregated by the Republic of Kazakhstan, regions and types of renewable energy (bioenergy, hydropower, solar energy, wind energy)
7. Comparability with international data/standards	-
