

1. Information about the indicator	
Goal	Protection, restoration of terrestrial ecosystems and promotion of their rational use, rational forest management, combating desertification, stopping and reversing the process of land degradation and ending the process of loss
Task	By 2030, ensure the conservation of mountain ecosystems, including their biodiversity, in order to enhance their ability to provide benefits necessary for sustainable development.
The indicator	The proportion of protected mountain areas that are important from the point of view of biological diversity
2. Information about the organization	
Organization	Committee of Forestry And Wildlife of The Ministry Of Ecology And Natural Resources Of The Republic Of Kazakhstan
3. Definitions and concepts	
Definition	The indicator "Protected area coverage of important sites for mountain biodiversity" shows temporary trends in the proportion of important sites for mountain biodiversity (that is, those that significantly contribute to global biodiversity conservation) that are fully covered by certain Protected Areas
Basic concepts:	Protected areas, as defined by the International Union for Conservation of Nature (IUCN; Dudley 2008), are clearly defined geographical areas that are recognized, allocated and managed through legal or other effective means to achieve long-term conservation of nature with appropriate natural resources and cultural values. It is important to note that within the framework of this definition, which covers conservation, restoration and sustainable use, the following types of specialized managed facilities (protected areas) are distinguished - categories: 1. a) A complete nature reserve, b) A Nature reserve (an area untouched by human activity; 2. National Park; 3. A natural monument or a special natural object; 4. Habitat/species management area (land protection); 5. Protected landscape / seascape; 6. Protected area with sustainable use of natural resources. The status of "designated" (active) is assigned to a protected area when the relevant authority, in accordance with national legislation or general practice (for example, by executive decree, etc. in accordance with paragraph), officially approves the document of appointment. The assignment should be carried out for the purposes of preserving biodiversity, and not for the purpose of actual protection of certain areas, for other actions (for example, military).
Justification and interpretation	The protection of important sites is essential to prevent the decline of biodiversity and ensure the long-term and sustainable use of mountain natural resources.
4. Data sources and collection methods	
Data sources	The source is the State forest cadastre and the cadastre of specially protected natural territories.
Data collection methods	The reports are provided by the State national nature parks, State nature reserves and State forest nature reserves.
Unit of measurement	Percent

Periodicity	Annual
5. Calculation method and other methodological considerations	
Calculation method:	The share of protected areas among the sites important for mountain biodiversity is calculated as a percentage of the total area of specially protected natural territories.
Comments and restrictions:	The share of protected areas among areas important for mountain biodiversity, such as the area of specially protected natural territories, has a special status and restrictions on their territory are carried out in accordance with the Law of the Republic of Kazakhstan "On Specially Protected Natural Territories" dated July 7, 2006 and subordinate regulations.
6. Data availability and disaggregation	
Data availability and gaps:	General information is available on the United Nations Programme website.
The level of disaggregation:	The data is disaggregated by land categories, zoning, and the specifics of its limitations established by legislation in the field of specially protected natural areas.
7. Comparability with international data/standards	Discrepancies may exist between the indicator data among internationally represented countries, as the proportion of protected areas among areas important for mountain biodiversity, such as specially protected natural areas, varies by area.
