

1. Information about the indicator	
Goal	Ensuring the openness, security, resilience and environmental sustainability of cities and towns
Task	By 2030, reduce the negative environmental impact of cities on a per capita basis, including by paying special attention to air quality and the disposal of urban and other waste.
The indicator	The share of recycling and disposal of municipal solid waste in their formation
2. Information about the organization	
Organization	Ministry of Ecology and Natural Resources of the Republic of Kazakhstan, Local executive bodies
3. Definitions and concepts	
Definition	Waste recycling is a physical, chemical or biological process, including sorting, aimed at extracting raw materials and (or) other materials from waste that are later used in the production (manufacture) of goods or other products, as well as changing the properties of waste in order to facilitate their handling, reduce their volume or dangerous properties. Waste disposal is the use of waste as secondary material or energy resources.
Basic concepts:	Consumer waste is the remains of products, products and other substances formed during their consumption or operation, as well as goods (products) that have lost all or part of their original consumer properties. Solid household waste is municipal waste in solid form.
Justification and interpretation	The Concept for the transition of the Republic of Kazakhstan to a "green" economy, approved by Decree of the President of the Republic of Kazakhstan dated May 30, 2013 No. 577 (hereinafter referred to as the Concept). According to the Concept, by 2030 the share of recycled waste should be 40%, and by 2050 – 50%. Articles 288, 292, 298-301 of the Environmental Code of the Republic of Kazakhstan.
4. Data sources and collection methods	
Data sources	The source is data from the local executive authorities of Astana, Shymkent, Almaty and the regions.
Data collection methods	An official request to the local executive authorities
Unit of measurement	Percent
Periodicity	Quarterly
5. Calculation method and other methodological considerations	
Calculation method:	The share of industrial waste disposal is calculated as follows: 1. The total volume of generated industrial waste is determined for each region and cities of national importance according to the formula: $V_{obr} = V_1 + V_2 + \dots + V_n,$ where, V_{obr} – the total volume of generated waste in the republic, V_1, V_2, V_n - volume of waste generated by region (cities and

	regions); 2. The total volume of disposed production waste for each region and cities of national importance is determined according to the formula: $V_{util} = V_a + V_6 + \dots + V_H,$ where, V_{util} – the total volume of disposed production waste in the republic, V_a, V_6, V_H - volume of disposed production waste by region (cities and regions); 3. Determination of the percentage of industrial waste disposal. The total volume of recycled production waste is multiplied (V_{util}) It is divided by 100 and is divided by the total amount of industrial waste generated (V_{obr}). $\%util = V_{util} * 100 / V_{obr},$ where, $\%util$ – the total percentage of industrial waste disposal.
Comments and restrictions:	-
6. Data availability and disaggregation	
Data availability and gaps:	The data is available on the website of the Ministry of Ecology and Natural Resources of the Republic of Kazakhstan.
The level of disaggregation:	The data is disaggregated by geographical location
7. Comparability with international data/standards
