

1. Information about the indicator	
Goal	Protection, restoration of terrestrial ecosystems and promotion of their rational use, rational forest management, combating desertification, stopping and reversing the process of land degradation and ending the process of loss
Task	Take immediate measures to put an end to poaching and smuggling of protected species of flora and fauna, and address both the demand for and supply of illegal wildlife products.
The indicator	Percentage of wild animals that are the object of poaching or illegal trafficking, for species that are traded
2. Information about the organization	
Organization	Committee of Forestry and Wildlife of the Ministry of Ecology and Natural Resources of the Republic of Kazakhstan, RSE "PO Okhotzooptom", Institute of Zoology of the Ministry of Science and Higher Education of the Republic of Kazakhstan
3. Definitions and concepts	
Definition	Conservation and protection of rare and endangered species of wild ungulates and saigas of Kazakhstan on the basis of regulatory, legal, organizational and economic measures that exclude mass poaching and ensure the stabilization and restoration of their populations
Basic concepts:	Step up global efforts to combat poaching and the smuggling of protected species, including by increasing the opportunities available to local populations to earn their livelihoods in an environmentally sound manner.
Justification and interpretation	The share of all wildlife trade is recognized as insignificant. Ensure the conservation of rare and wild ungulates. Since the illegal wildlife trade is represented by thousands of different goods, an aggregation method is needed in this case. The value of legal trade does not reflect the true market value of the confiscated (seized) items and the true value of legal supplies, as it is derived from a single market source (US lemis). However, it represents logical and consistent aggregation methods.
4. Data sources and collection methods	
Data sources	The source is statistical data within the framework of contractual obligations "Accounting and monitoring of the number of rare and endangered species of ungulates".
Data collection methods	Methodological recommendations for accounting for certain types of wild animals were approved by the Order of the Minister of Agriculture of the Republic of Kazakhstan dated March 1, 2012 No. 25-03-01/82. Registered with the Ministry of Justice of the Republic of Kazakhstan on March 28, 2012 No. 7492. "On approval of the Instructions for keeping records of animal species in the territory of the Republic of Kazakhstan"
Unit of measurement	Unit
Periodicity	Annual
5. Calculation method and other methodological considerations	
Calculation method:	The cost of a unit of a certain type of product is calculated based on the weighted average price announced for the legal import of similar types of units purchased from law enforcement agencies.
Comments and restrictions:	Organization of protection of rare and endangered species of wild ungulates and saigas to a level that ensures the exclusion of mass

	poaching; strengthening legislative measures for the conservation of rare and endangered species of wild ungulates and saigas; organization of reliable, effective annual accounting of the number of rare and endangered species of wild ungulates and saigas; organization of a system of control (monitoring) over populations and habitats of rare and endangered species of wild ungulates and saigas; conducting scientific research on the development of biotechnological foundations for the conservation of the gene pool and determining the optimal number of rare and endangered species of wild ungulates.
6. Data availability and disaggregation	
Data availability and gaps:	Data on legal trade is reported annually by the CITES parties and stored in the CITES Database.
The level of disaggregation:	Where baseline data is available, it can be disaggregated to a national level. Gender, age, and disability issues do not apply to this form of trading.
7. Comparability with international data/standards	The jeyran is included in the Red Books of the International Union for Conservation of Nature and Kazakhstan as a rare species, whose numbers and habitats are declining for life. The kulan is a rare species, whose abundance and range in the republic are very limited. It is listed in the Red Book of the International Union for Conservation of Nature (hereinafter - IUCN) and Kazakhstan. It is one of the 9 species of the horse genus and the only one currently living in Kazakhstan. After Kazakhstan joined the CITES Convention in 2000, our state had the opportunity, along with other parties to the Convention, to regulate and control trade in products of rare and endangered species of animals, including ungulates and saigas. Among the priority measures should be strengthening customs and border control in order to close the channels for the smuggling of parts and derivatives of illegally extracted rare and endangered species of ungulates and saigas from the country.
