1. Information about the indicator	
The goal	Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all
Task	By 2030, ensure that all girls and boys complete free, equitable and quality primary and secondary education leading to relevant and effective learning outcomes
Indicator name of the global indicator National indicator	Percentage of children and youth who graduate from primary school/have achieved at least the minimum level of i) reading literacy by gender **(PIRLS)**
2. Information about the organization	
Organization	Ministry of Education of the Republic of Kazakhstan
3. Definitions and concepts	
Definition	Percentage of children in primary education who have achieved at least a minimum level of reading literacy.
Basic concepts	The minimum level of professional training is a benchmark of basic knowledge in a field (mathematics or reading), measured by a learning assessment. The Reading Literacy Assessment Survey (PIRLS) has four levels: low, medium, high, and advanced. Students who have reached the intermediate level (the benchmark) can apply basic knowledge in a variety of situations, similar to the idea of minimal skill.
Justification and explanation	The indicator is a direct indicator of the learning outcomes achieved in two subject areas at the end of the respective learning stages. The three measurement points will have their own set minimum standard. There is only one threshold that divides students into levels above and below the minimum: (a) Below the minimum is the proportion or percentage of students who do not achieve the minimum standard set by countries in accordance with globally defined minimum competencies (b) Above the minimum is the proportion or percentage of students who have achieved the minimum standards. Due to the heterogeneity of performance levels established by national and international assessments, these performance levels should be displayed at the global level with minimal performance levels. After the performance indicators are compared, the global educational community will be able to determine for each country the proportion or percentage of children who have achieved minimum standards.
4. Sources and collection methods	
Data sources	PIRLS Results
Data collection methods	International PIRLS Study
Unit of measurement	Percent
Frequency	The PIRLS study takes place every 5 years, 31.12.2026
5. Calculation method and other methodological considerations	
Calculation method:	Data collection is carried out by performing cognitive test tasks. The assessment of reading literacy in the Girls study is conducted on a 1000-point scale (mostly the results of the countries range from 300 to 700 points). In PIRLS, students' results are divided into four levels (low, medium, high, and advanced), which characterize the degree of difficulty in working with text. The share of students who completed at least low-level assignments includes the results of those who completed tasks at more complex levels.
Reviews and restrictions:	A representative sample makes it possible to generalize (summarize) conclusions at the country-wide level.
6. Data availability and fragmentation	

Data availability and gaps:	The data is available on the website of JSC Taldau MP RK
Disassembly level:	The data is disaggregated by gender
7. Comparison with international data / standards	The results obtained are comparable with the results of other countries participating in the study.
8. References and documentation	PIRLS-2016 data is available on the IEAhttps https://timssandpirls.bc.edu/ PIRLS-2021 data is available on the IEA website at the following link: https://pirls2021.org/results

1. Information about the indicator	
The goal	Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all
Task	By 2030, ensure that all girls and boys complete free, equitable and quality primary and secondary education leading to relevant and effective learning outcomes
Indicator name of the global indicator National indicator	The proportion of children and youth who graduate from secondary school who have achieved at least the minimum level of (i) reading literacy (ii) numeracy (mathematical literacy) skills by gender **(PISA).**
2. Information about the organization	
Organization	Ministry of Education of the Republic of Kazakhstan
3. Definitions and concepts	
Definition	The object of the research is the educational achievements of students aged 15.
Basic concepts	The PISA international study is aimed at assessing the ability to apply the knowledge and skills acquired during training in life situations, competence in solving problems that are not directly related to certain academic subjects or educational fields. The research toolkit aims to assess the formation of general learning skills in solving problems that students may encounter in life and function effectively in modern society.
Justification and explanation	The main objective of the PISA study is to analyze the real results obtained within the framework of objective measurements based on tools reflecting global priorities in the field of education, and to extract from them scientifically sound and constructive conclusions for educational policy.
4. Sources and collection methods	
Data sources	PISA results
Data collection methods	The PISA International Study
Unit of measurement	percent
Frequency	PISA – every 3 years, starting in 2025 – every 4 years, years, 31.12.2026
5. Calculation method and other methodological considerations	
Calculation method:	Data collection is carried out by performing cognitive test tasks. The reading and mathematical literacy tests of the PISA International Study are divided into six levels of difficulty, and the academic performance of each test taker is associated with a certain level indicating his competence. In the study, level 2 is defined as the "minimum level". The share of those who have completed tasks of at least 2 levels includes the results of those who have completed tasks of more complex levels.

Reviews and restrictions:	A representative sample makes it possible to generalize (summarize) conclusions at the country-wide level. Since 2018, the PISA sample has been increased. This allowed for a deeper analysis within each region.
6. Data availability and fragmentation	
Data availability and gaps:	The data is available on the website of Taldau JSC of the Ministry of Agriculture of the Republic of Kazakhstan, as well as on the OECD website.
Disassembly level:	The data is disaggregated by gender and by region for 2018 and 2022.
7. Comparison with international data / standards	The results obtained are comparable with the results of other countries participating in the study.
8. References and documentation	The results of CISA2022 are available on the OECD website: https://www.oecd.org/en/publications/pisa-2022-results-volume-i_53f23881-en.html The PISA database (2000-2022) is available on the OECD website: https://www.oecd.org/en/data/datasets/pisa-2022-database.html#data

1. Information about the indicator	
The goal	Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all
Task	By 2030, ensure that all girls and boys complete free, equitable and quality primary and secondary education leading to relevant and effective learning outcomes
Indicator name of the global indicator National indicator	The proportion of children and youth who graduate from elementary school and grades 8 who have achieved at least the minimum level (ii) of numeracy (mathematics) skills (TIMSS)
2. Information about the organization	
Organization	Ministry of Education of the Republic of Kazakhstan
3. Definitions and concepts	
Definition	The main objective of the TIMSS study is to analyze the real results obtained within the framework of objective measurements based on tools reflecting global priorities in the field of education, and to extract from them scientifically sound and constructive conclusions for educational policy.
Basic concepts	The international TIMSS study is conducted in two areas: "mathematical" and "natural science", in which special attention is paid to assessing students' mastery of general academic and intellectual skills.
Justification and explanation	The aim of the international TIMSS study is to compare the assessment of the natural mathematics education of secondary school students in countries with different education systems and to identify the factors influencing the level of this training.
4. Sources and collection methods	
Data sources	TIMSS Results
Data collection methods	International TIMSS survey
Unit of measurement	percenta
Frequency	TIMSS – every 4 years, years, 31.12.2026
5. Calculation method and other methodological considerations	
Calculation method:	Data collection is carried out by performing cognitive test tasks.The test tasks of

	the international TIMSS study are divided into four levels of difficulty: low, medium, high and advanced. According to the research technology, the share of students who completed at least low-level assignments includes the results of those who completed tasks at more complex levels. Students who have reached the advanced level complete the tasks of the previous three levels accordingly.
Reviews and restrictions:	A representative sample makes it possible to generalize (generalize) conclusions to the general population of the country.
6. Data availability and fragmentation	
Data availability and gaps:	The data is available on the website of JSC Taldau Ministry of Education of the Republic of Kazakhstan
Disassembly level:	The data is disaggregated by gender
7. Comparison with international data / standards	The results obtained are comparable with the results of other countries participating in the study.
8. References and documentation	TIMSS data is available on the IEA website https://timssandpirls.bc.edu/ The results of TIMSS-2023 are available at the following link: https://timss2023.org/results/
