

1. Information about the indicator	
Goal	Ensuring access to affordable, reliable, sustainable and modern energy sources for all
Task	Double the global energy efficiency target by 2030
The indicator	Energy intensity of the GDP
2. Information about the organization	
Organization	Bureau of National Statistics of the Agency for Strategic Planning and Reforms of the Republic of Kazakhstan
3. Definitions and concepts	
Definition	The energy intensity index of GDP is defined as the ratio of the volume of gross consumption of fuel and energy resources for all production and non-production needs.
Basic concepts:	The energy intensity of the economy is a particular indicator of natural resource intensity. This is a key indicator that characterizes the sustainability of the development of both the country as a whole and the energy sector. This indicator is one of the basic indicators in most sustainability systems.
Justification and interpretation	Energy intensity is an indicator of how much energy is used to produce one unit of economic output. It is an indicator of the efficiency with which an economy can use energy to produce economic products. A lower coefficient indicates that less energy is used to produce one unit of power.
4. Data sources and collection methods	
Data sources	The source is statistical data from Form 1-FEB "Fuel and Energy balance".
Data collection methods	Estimated indicator
Unit of measurement	Tons of oil equivalent per thousand US dollars
Periodicity	annually
5. Calculation method and other methodological considerations	
Calculation method:	The energy intensity index of GDP is defined as the ratio of gross consumption of fuel and energy resources for all production and non-production needs in tons of oil equivalent to GDP.
Comments and restrictions:	Energy intensity is just an imperfect proxy indicator of energy efficiency. It can be influenced by a number of factors such as climate, economic structure, the nature of economic activity, etc., which are not necessarily related to pure efficiency.
6. Data availability and disaggregation	
Data availability and gaps:	Bureau of National Statistics of the Agency for Strategic Planning and Reforms of the Republic of Kazakhstan
The level of disaggregation:	Energy intensity disaggregation, for example by sector, can provide additional information on progress in energy efficiency. It is currently possible to calculate such disaggregations for the following sectors - industry, residential, transportation, agriculture, and households - as reported in the Global Tracking System. Over time, it would be desirable to develop more advanced industry-level energy intensity indicators that allow, for example, to look at the energy intensity of an industry (for example, cement, steel) or a type of vehicle (for example, cars, trucks). This will not be possible without statistical cooperation

	with the relevant energy consumption sectors. Energy intensity trend decomposition analysis aims to filter out factors that influence energy demand, such as changes in the scale of the economy and structural shifts, from more narrowly defined shifts in energy intensity. The methodology applies decomposition analysis to identify a more advanced energy intensity indicator that filters out the time shift in the relative weights of the sector. This analysis is also presented in the Global Tracking System.
7. Comparability with international data/standards	-
