

1. Information about the indicator	
Goal	Reducing inequality within and between countries
Task	By 2030, the share of people with incomes below 50% of the median income in the Republic of Kazakhstan will gradually achieve and maintain income growth.
The indicator	The proportion of people with incomes below 50% of the median income in the Republic of Kazakhstan
2. Information about the organization	
Organization	Bureau of National Statistics of the Agency for Strategic Planning and Reforms of the Republic of Kazakhstan
3. Definitions and concepts	
Definition	The proportion of people with incomes (consumption) below 50% of the median income is the proportion of the country's population living on less than half of the income level (income used for consumption).
Basic concepts:	Median income is the value of the indicator at the center of the income distribution series. The income of the population used for consumption includes consumer expenses (excluding investments in production activities and accumulation) and the cost (in monetary terms) of in-kind products of own production and transfers consumed.
Justification and interpretation	Addressing the issue of social inclusion and inequality is important both for the global development agenda and for the national development agenda of many countries. The proportion of the population living with incomes below 50% of the national average income is an indicator that is useful for monitoring the level and trends of social integration, relative poverty and inequality within the country. The proportion of people living with incomes below 50% of median income is an indicator of relative poverty and income inequality within a country. This indicator and similar relative indicators are commonly used to measure poverty in rich countries (including the Organization for Economic Cooperation and Development (OECD) on poverty indicators and Eurostat's indicators of poverty or social exclusion) and are increasingly being used as an additional indicator of inequality and poverty in low- and middle-income countries.
4. Data sources and collection methods	
Data sources	Household budget survey
Data collection methods	Household budget survey
Unit of measurement	Percent
Periodicity	annual
5. Calculation method and other methodological considerations	
Calculation method:	The indicator is measured using the national distribution of consumption or per capita income derived from surveys. The indicator is calculated by estimating the percentage of the population living with an income of less than 50% of the median national income distribution or consumption. The median is estimated using the same distribution from which the indicator is calculated, so 50% of the median threshold value will change over time.

	Per capita income or consumption is estimated using the total household income or consumption divided by the total household size.
Comments and restrictions:	
6. Data availability and disaggregation	
Data availability and gaps:	The data is available on the website of the Bureau of National Statistics of the Agency for Strategic Planning and Reforms of the Republic of Kazakhstan.
The level of disaggregation:	Across the Republic
7. Comparability with international data/standards	It is calculated without using a national income equivalence scale, and international comparability is ensured.
