

1. Information about the indicator	
Goal	Ensuring the availability and rational use of water resources and sanitation for all
Task	By 2030, ensure integrated water resources management at all levels, including, if necessary, through cross-border cooperation.
The indicator	The degree of implementation of integrated water resources management
2. Information about the organization	
Organization	Ministry of Water Resources and Irrigation of the Republic of Kazakhstan
3. Definitions and concepts	
Definition	The indicator of the degree of implementation of Integrated Water Resources Management (IWRM), measured as a percentage (%) from 0 (implementation has not yet begun) to 100 (fully implemented), is currently measured in terms of the various stages of development and implementation of Integrated Water Resources Management (IWRM)
Basic concepts:	The indicator provides a direct measurement of progress in the first part of Task Force 6.5 "to implement integrated water resources management at all levels". The percentage score is a simple and understandable way to measure progress towards achieving a goal, with "0" interpreted as no implementation of the IWRM, and "100" interpreted as a fully implemented IWRM. For further interpretation and comparison of the results, indicators can be classified in a similar way as survey questions.: Degree of implementation = It doesn't matter - Very low (0-9.9) In development - Low (10-29.9) Developed, not implemented - Medium-low (30-49.9) Implementation has begun - Medium-high (50-69.9) Implemented, there is progress - High (70-89.9) Fully implemented - Very high (90-100)
Justification and interpretation	The concept of the survey is that it provides sufficient information that has real value for countries in determining their progress towards achieving the goal, as well as through this, the various aspects of IWRM.
4. Data sources and collection methods	
Data sources	The data sources are government agencies related to the water sector, such as agriculture, energy, water supply and the environment, as well as water resources management at various administrative levels.
Data collection methods	Data collection is carried out through the international questionnaire "The degree of implementation of integrated water resources management"
Unit of measurement	Percent
Periodicity	every two years
5. Calculation method and other methodological considerations	
Calculation method:	1. The survey contains 32 questions divided into four main components. 2. Each question is assigned a score from 0 to 100 in increments of

	10 points in the following 6 main categories: • Very Low (0) • Low (20) • Medium-low (40) • Medium-high (60) • High (80) • Very High (100) Guidelines are provided for each threshold for each question to ensure objective and comparable results. 3. The weighted average of the number of questions in each of the four components is calculated so that the score of each component is 0-100. 4. The component scores are averaged (not weighted) to obtain a score expressed as a percentage between 0 and 100.
Comments and restrictions:	-
6. Data availability and disaggregation	
Data availability and gaps:	
The level of disaggregation:	Republic of Kazakhstan
7. Comparability with international data/standards
